

# AIRPLANES STILL SAFEST WAY TO TRAVEL

## Comparing Crash Data

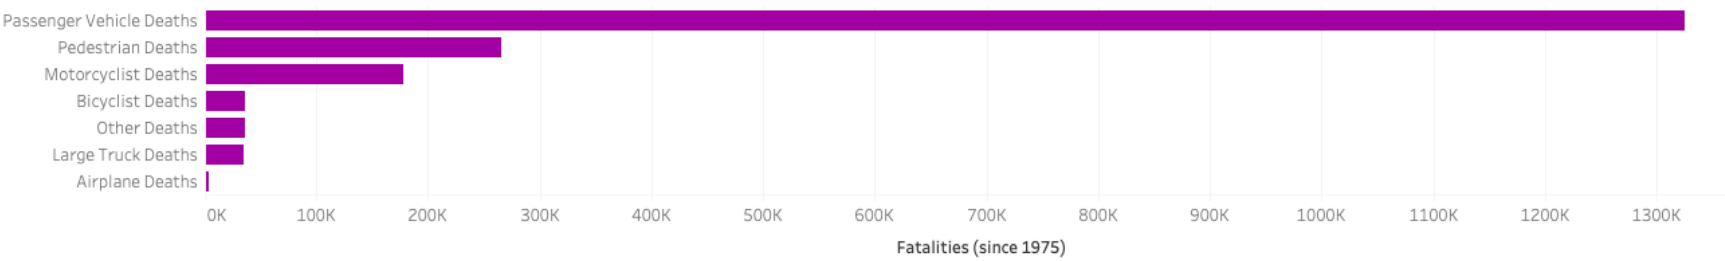

YOU ARE 22X MORE LIKELY TO DIE IN A CAR CRASH

FEWER FATALITIES THAN ANY OTHER MODE OF TRANSPORT

You are more likely to die as a pedestrian than a passenger on a plane.

Based on data over the last 50 years, airplanes have accumulated the fewest deaths than any other mode of transportation at 3200 deaths compared to 1.3 million passenger car deaths and 265,000 pedestrian deaths.

AIRPLANES HAVE BECOME EVEN SAFER SINCE 9/11

Even as air miles continue to rise. Can the same be said about cars?

There have been very few deaths as the result of airplane crashes since 2001. This is in part due to safety and pilot protocols put in place, including safety audits, improved air traffic control technology and crashworthiness (floatation devices, oxygen masks, etc).
